Cobras at the Aussies' border... EM Solutions' Cobra-class satellite communications terminals for Australian Border Force

*The Australian Border Force is receiving Inmarsat's (LSE: ISAT.L) Global Xpress global mobile satellite service as eight maritime vessels have recently been fitted with new Cobra-class satellite communications terminals, designed, developed and manufactured by EM Solutions. These products enable governments to augment the capacity they have on government-owned satellites with commercial satellites.*

The terminals, which will be used by the Department of Immigration and Border Protection (DIBP), are specifically designed to provide reliable communications in even the most inhospitable maritime environments. The enhanced functionality will allow the DIBP to improve its surveillance capability and improve the speed at which it can transfer data as well as increasing its communication capacity.

Andy Start, President, Inmarsat Global Government, said that this contract ensures the Department of Immigration and Border Protection remains at the forefront of communications technology while allowing it to continue to leverage its existing government-owned communications satellites. The broadband services and terminals augment and enhance what is possible for Australia’s border protection crews in order to keep them connected at all times.

Dr. Rowan Gilmore, CEO of EM Solutions added that they are delighted to have had the opportunity to collaborate with Inmarsat and the Australian Border Force to supply their new Cobra terminals to the project. These terminals are the first of their kind to operate on both the commercial Inmarsat Global Xpress satellite system as well as the military Wideband Global Satcom satellite constellation, to provide more assured communications. As a result of this development we have already seen interest expressed by navies from around the world.

The high-speed satellite communications terminals can be engineered to meet the specifications and needs of a wide range of consumers. The multi-satellite capability of our Cobra terminal is a prime example. By partnering with
leading-edge customers in government and industry, we were able to evolve our product to match their expectations and enhance the value of their own services.”

Dave Luhrs, Commander, Air and Marine, Department of Immigration and Border Protection shared that at the operational level, the ability to switch between satellite systems enables then crew to prioritise their communications and ensures they are ‘always on’, which is of paramount importance when protecting our borders.”

As part of Inmarsat’s commitment, a fourth Global Xpress satellite (I-5 F4) has completed construction and testing by Boeing in California, and is likely to be launched in mid-2017 in order to provide additional GX capacity.
